AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions and listings of claims in the application:

1-15. (Cancelled).

16. (Currently Amended) A bypass conduit for use in a wall of a heart, comprising:

a hollow conduit having an interior and an exterior and adapted to be positioned in the heart wall between a coronary vessel and a chamber in the heart, wherein the conduit has an attachment mechanism on at least one end adapted to anchor the conduit in place.

wherein the conduit is sufficiently rigid such that a pathway between the coronary vessel and the chamber defined by the conduit remains open during both systole and diastole.

- 17. (Withdrawn) The device of claim 16, wherein the conduit is expanded using an inflatable balloon.
- 18. (Previously Presented) The device of claim 16, wherein the chamber is the left ventricle.

- 19. (Previously Presented) The device of claim 16, wherein the attachment mechanism is selected from the group consisting of hooks, barbs, flanges, collars, suture holes, and expandable legs.
- 20. (Previously Presented) The device of claim 16, wherein the attachment mechanism is adapted to anchor the conduit in the heart wall.
- 21. (Previously Presented) The device of claim 16, wherein the attachment mechanism is adapted to anchor the conduit in the coronary vessel.
- 22. (Currently Amended) A bypass conduit for use in a wall of a heart, comprising:

a hollow conduit having a plurality of circular rings, an interior, and an exterior and adapted to be positioned in the heart wall between a coronary vessel and a chamber in the heart, wherein the conduit has an attachment mechanism on at least one end adapted to anchor the conduit in place.

wherein the conduit is sufficiently rigid such that a pathway between the coronary vessel and the chamber defined by the conduit remains open during both systole and diastole.

23. (Withdrawn) A conduit for placing a coronary vessel of a patient's heart in communication with a heart chamber, the conduit comprising:

a tubular element including first and second portions having different crosssectional sizes, the tubular element having a bore defining a blood flow path;

wherein the cross-section of the first portion of the tubular element is larger than the cross-section of the second portion of the tubular element such that the tubular element is generally funnel-shaped; and

wherein the first and second portions of the tubular element are generally aligned and the bore defines a generally straight blood flow path.

24. (Currently Amended) A conduit for placing a coronary vessel of a patient's heart in communication with a heart chamber, the conduit comprising:

a tubular element configured to <u>be</u> positioned in the wall of a patient's heart, the tubular element including first and second ends and a bore defining a blood flow path; and

a vessel supporting mechanism carried by the tubular element, the vessel supporting mechanism being positioned on the conduit so as to contact and support the wall of a coronary vessel when the conduit is positioned in the heart wall.

wherein the conduit is sufficiently rigid such that the blood flow path remains open during both systole and diastole.

25. (Withdrawn) The conduit of claim 24, wherein the tubular element is a rigid, solid walled structure.

26-30. (Cancelled).

- 31. (Previously Presented) The device of claim 16, wherein the coronary vessel is a coronary artery.
 - 32. (Cancelled).
- 33. (Previously Presented) The device of claim 16, wherein the conduit includes a plurality of rings.
- 34. (Previously Presented) The device of claim 16, wherein the conduit includes a membrane.
- 35. (Previously Presented) The device of claim 34, wherein the conduit includes a plurality of rings and the membrane surrounds the plurality of rings.
- 36. (Previously Presented) The device of claim 16, wherein the conduit defines a lumen and the conduit is configured to prevent the lumen from collapsing by reason of contraction of the wall surrounding the conduit.
- 37. (Previously Presented) The device of claim 16, wherein the conduit defines a channel that includes an angled or curved portion.

- 38. (Previously Presented) The device of claim 16, wherein the conduit is configured to expand and contract.
- 39. (Previously Presented) The device of claim 16, wherein the attachment mechanism is configured to contact an inner surface of the chamber.
- 40. (Previously Presented) The bypass conduit of claim 22, wherein the coronary vessel is a coronary artery.
- 41. (Previously Presented) The bypass conduit of claim 22, wherein the chamber is a left ventricle.
 - 42. (Cancelled).
- 43. (Previously Presented) The bypass conduit of claim 22, wherein the conduit includes a membrane.
- 44. (Previously Presented) The bypass conduit of claim 43, wherein the membrane surrounds the plurality of circular rings.
- 45. (Previously Presented) The bypass conduit of claim 22, wherein the conduit defines a lumen and the conduit is configured to prevent the lumen from collapsing by reason of contraction of the wall surrounding the conduit.

- 46. (Previously Presented) The bypass conduit of claim 22, wherein the conduit defines a channel that includes an angled or curved portion.
- 47. (Previously Presented) The bypass conduit of claim 22, wherein the conduit is configured to expand and contract.
- 48. (Previously Presented) The bypass conduit of claim 22, wherein the attachment mechanism is configured to contact an inner surface of the chamber.
- 49. (Previously Presented) The bypass conduit of claim 22, wherein the attachment mechanism is selected from the group consisting of hooks, barbs, flanges, collars, suture holes, and expandable legs.
- 50. (Previously Presented) The bypass conduit of claim 22, wherein the attachment mechanism is adapted to anchor the conduit in the heart wall.
- 51. (Previously Presented) The conduit of claim 24, wherein the coronary vessel is a coronary artery.
 - 52. (Cancelled).

- 53. (Previously Presented) The conduit of claim 24, wherein the conduit includes a plurality of rings.
- 54. (Previously Presented) The conduit of claim 24, wherein the conduit includes a membrane.
- 55. (Previously Presented) The conduit of claim 54, wherein the conduit includes a plurality of rings and the membrane surrounds the plurality of rings.
- 56. (Previously Presented) The conduit of claim 24, wherein the conduit is configured to prevent the blood flow path from collapsing by reason of contraction of the wall surrounding the conduit.
- 57. (Previously Presented) The conduit of claim 24, wherein the conduit is configured to expand and contract.
- 58. (Previously Presented) The conduit of claim 24, further comprising an attachment mechanism on at least one end adapted to anchor the conduit in place.
- 59. (Previously Presented) The conduit of claim 58, wherein the attachment mechanism is configured to contact an inner surface of the chamber.

- 60. (Previously Presented) The conduit of claim 58, wherein the attachment mechanism is selected from the group consisting of hooks, barbs, flanges, collars, suture holes, and expandable legs.
- 61. (Previously Presented) The conduit of claim 58, wherein the attachment mechanism is adapted to anchor the conduit in the heart wall.
- 62. (Previously Presented) The conduit of claim 24, wherein the vessel supporting mechanism is substantially axially aligned with the coronary vessel.
- 63. (Previously Presented) The conduit of claim 24, wherein the vessel supporting mechanism extends substantially perpendicularly to the tubular element.
- 64. (Previously Presented) The conduit of claim 24, wherein the vessel supporting mechanism is configured to be in blood flow communication with the coronary vessel.
